Categories module

The categories module classifies money. Every category belongs to one profile and has one type, expense or income. Thirteen predefined categories are added to each new profile, and the owner can add custom ones. The other modules choose categories through the picker this module provides.

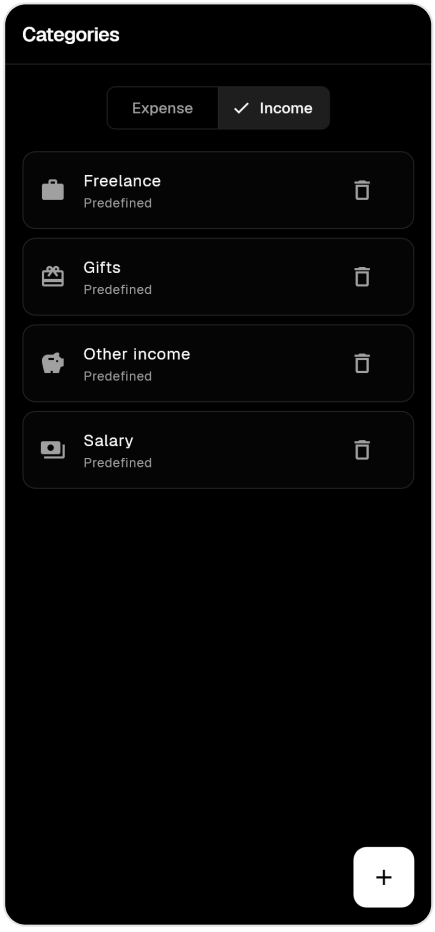

What it does

- Lists the profile's categories, split into expense and income.
- Creates a custom category with a name, a type and an icon from a fixed catalogue of 20 icons.
- Edits a category's name and icon; refuses a type change while the category is in use.
- Refuses duplicate names of the same type (case-insensitive).
- Deletes an unused category. A used one cannot be deleted until its transactions and budgets are moved to another category of the same type, which the screen offers.
- Provides the category picker used by the transaction and budget forms, filtered by type.

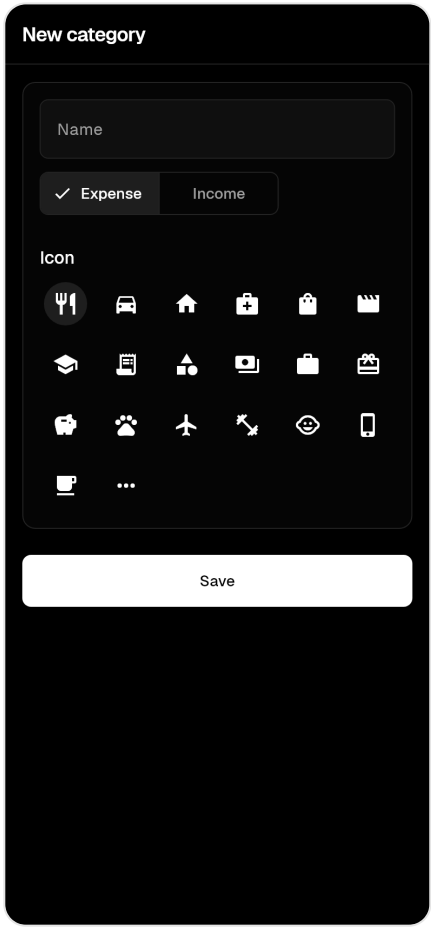

Screens

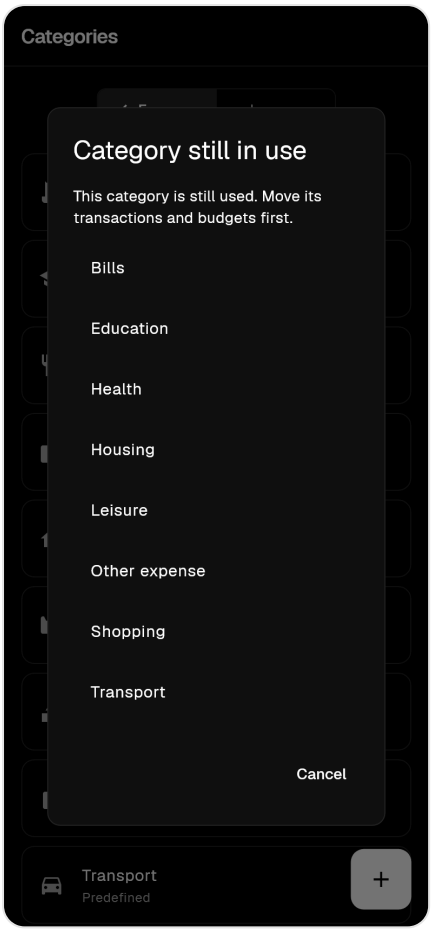

Expense categories
The predefined expense categories of the profile.

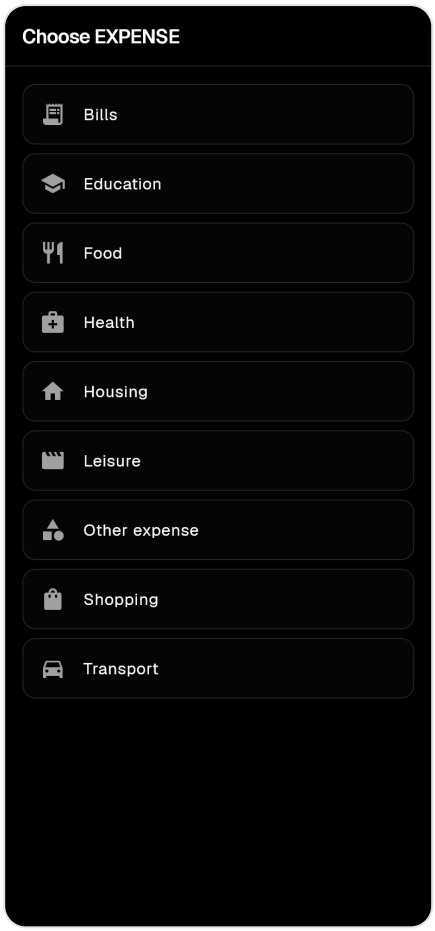

Income categories
The same list switched to income.

New category
Name, type and icon from the catalogue.

Category still in use
Food has transactions and a budget, so the app offers to move them first.

Category picker
Shared picker used by the other modules, here limited to expenses.

Screens rendered from the app in its dark theme with the built-in demo data.
