Transactions module

The transactions module records money coming in and going out. Each transaction has an amount, a type (expense or income), a category of the same type, a date and an optional description. Amounts are always positive; the type carries the direction. Budgets and the dashboard are calculated from these records.

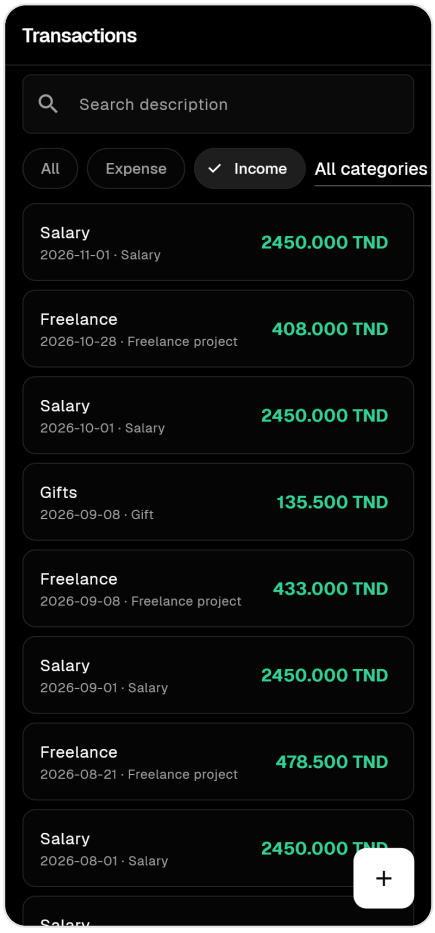

What it does

- Creates an expense or an income for the active profile.
- Checks that the amount is above zero and that the category matches the transaction type.
- Shows the history, newest first, with the category, date, description and a coloured amount.
- Searches descriptions and filters by type, category and date range; filters combine.
- Sorts by date, amount or category name, in either direction.
- Edits or deletes a transaction. Budget progress is recalculated, nothing else is removed.

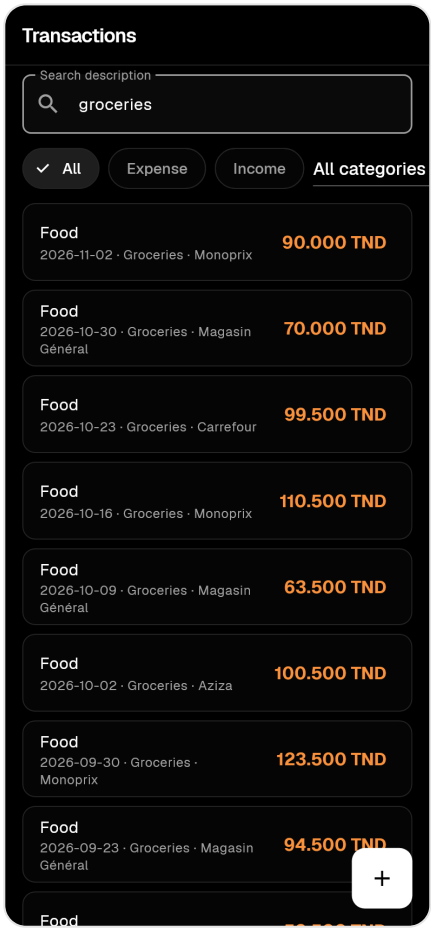

Screens

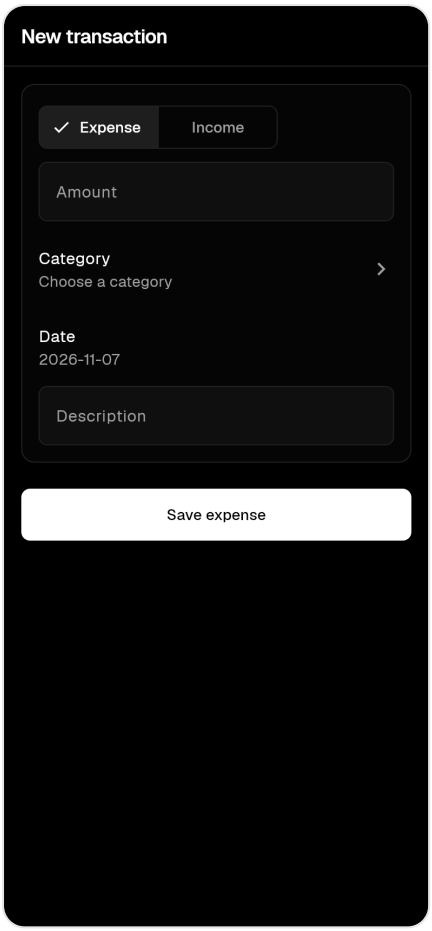

History
All transactions, newest first. Income in green, expenses in orange.

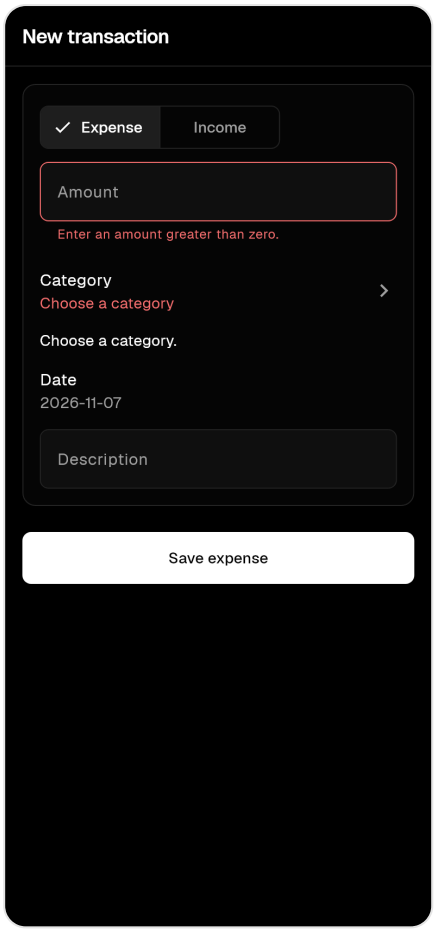

Income filter
Only income transactions.

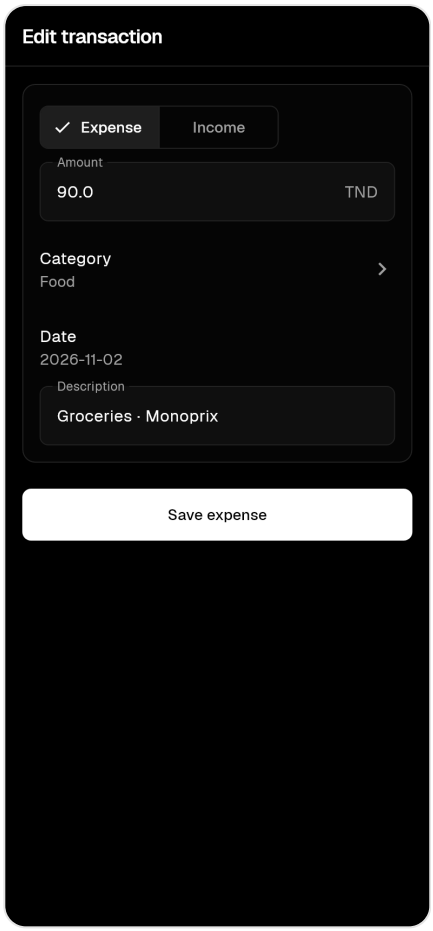

Search
Description search for “groceries”.

New transaction
Type, amount, category, date and description.

Form validation
Missing amount and category are refused.

Edit transaction
An existing grocery expense opened for editing.

Screens rendered from the app in its dark theme with the built-in demo data.
