Categories

The categories module classifies money. Every category belongs to one profile and is either an expense or an income category. Thirteen predefined categories are added to each new profile, and the owner can add custom ones with an icon from the built-in set or from thousands of free online icons. The other modules choose categories through the picker this module provides.

What it does

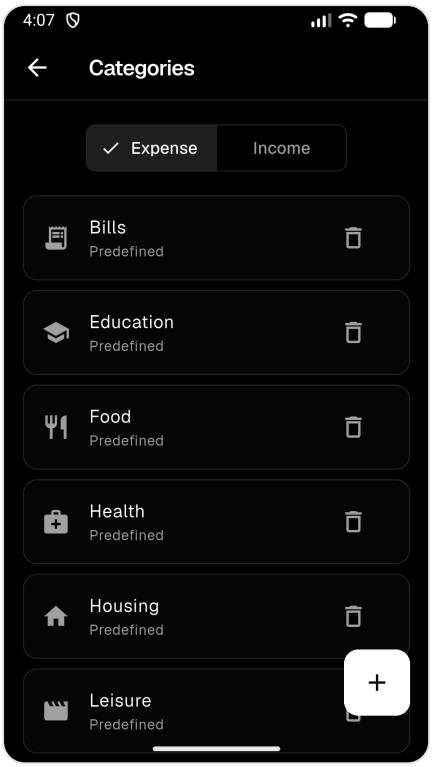

- Lists the profile's categories, split into expense and income, marked Predefined or Custom.
- Creates a category with a name, a type and an icon from the 20 built-in icons.
- Searches free online icons by keyword and uses the chosen one like a built-in icon.
- Edits a category's name and icon; refuses a type change while the category is in use.
- Refuses duplicate names of the same type (case-insensitive).
- Deletes an unused category. A used one is kept until its transactions and budgets are moved to another category of the same type, which the screen offers.
- Provides the category picker used by the transaction and budget forms, filtered by type.

Free APIs used

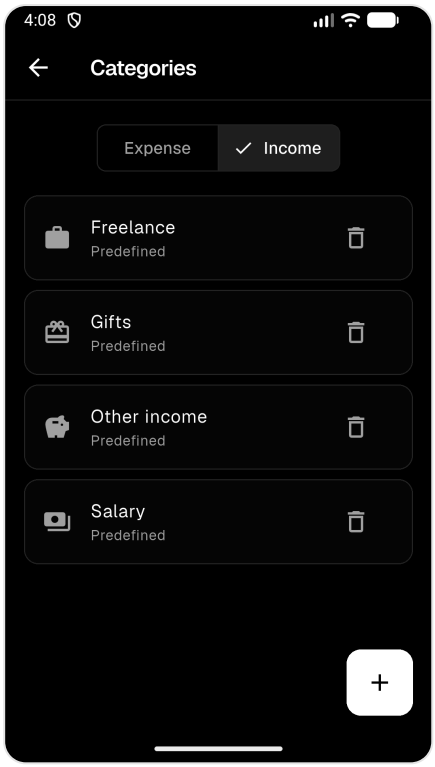

Iconify api.iconify.design

Icon search in the category form. Only Material Design Icons, Tabler and Material Symbols are searched, all free to use (Apache 2.0 or MIT). A chosen icon is downloaded once and kept on the phone, so it still shows offline.

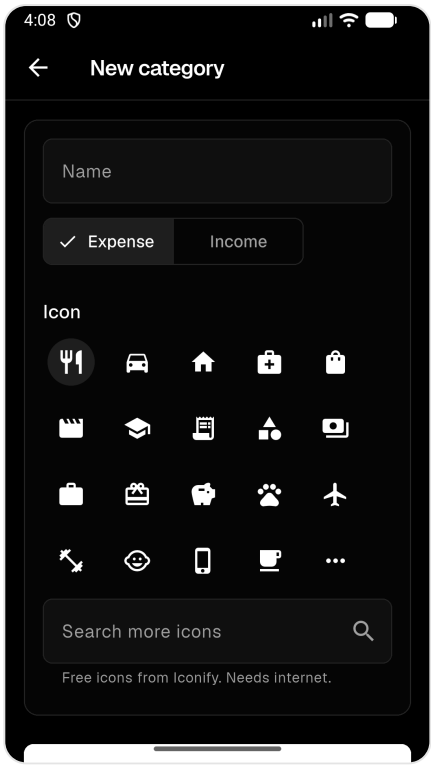

Screens

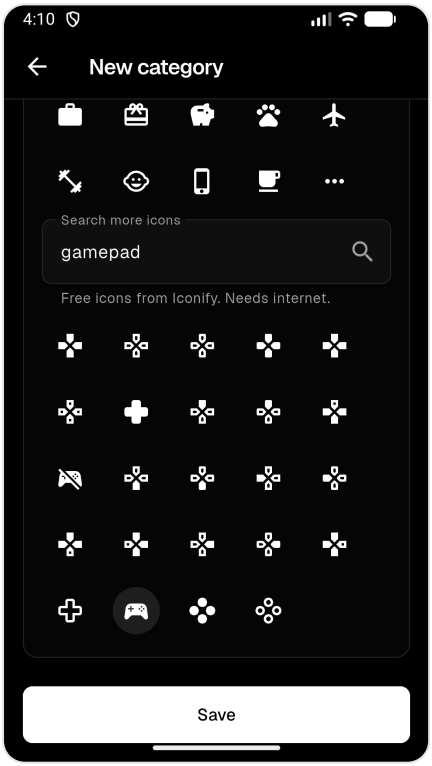

Expense categories
The profile's expense categories, predefined and custom.

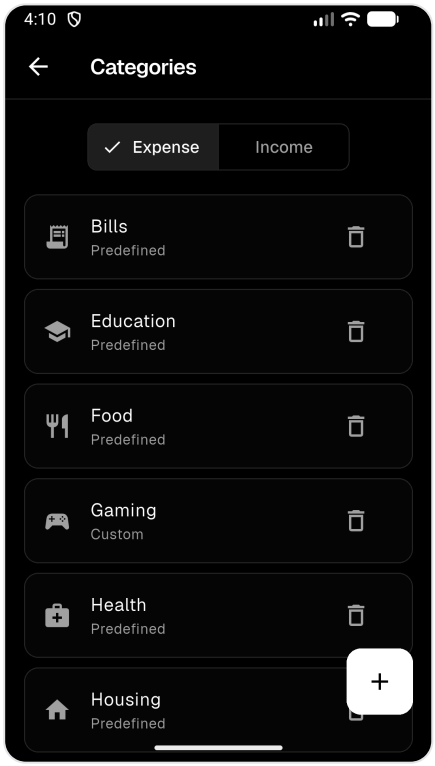

Income categories
The same list switched to income.

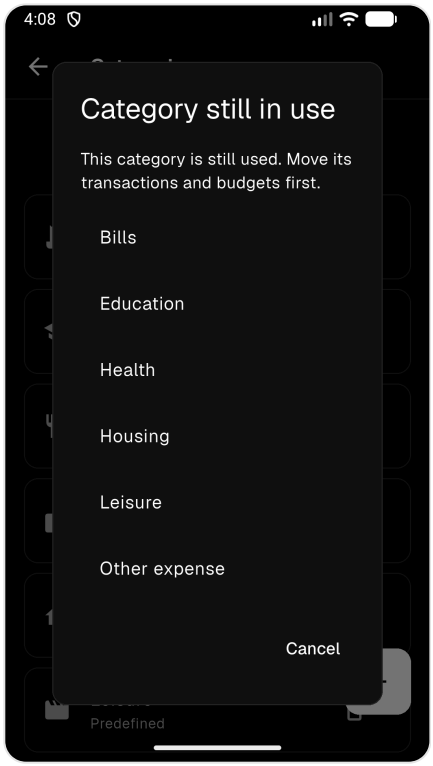

New category
Name, type, the 20 built-in icons and the online icon search.

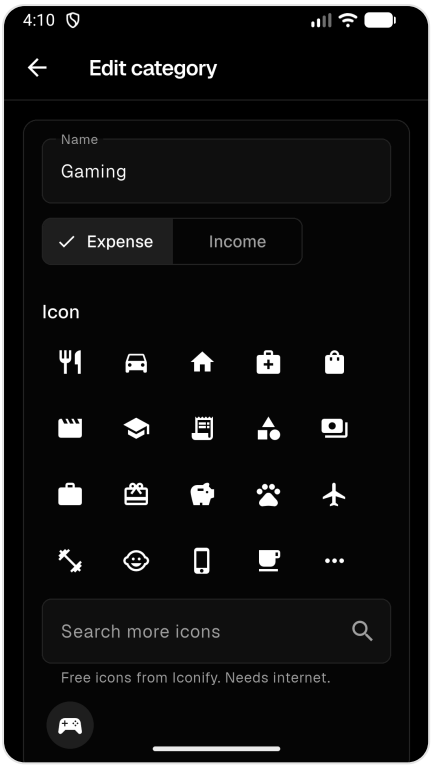

Online icon search
Searching “gamepad” returns free icons from Iconify; the controller is selected.

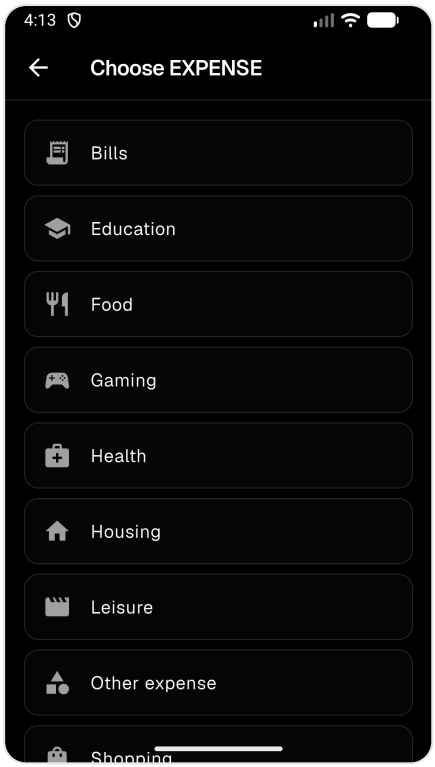

Custom category
The new Gaming category in the list, with its downloaded icon.

Category still in use
Food has transactions and a budget, so the app offers to move them first.

Edit category
The Gaming category opened for editing, keeping its online icon.

Category picker
The shared picker used by the other modules, here limited to expenses.

Screens captured on an Android emulator from the app in its dark theme (one in light), using the built-in demo data, November 2026.
